merl 7: Marine Mesocosms G.D. Grice, M.R. Reeve, 2012-12-06 Techniques developed for enclosing viable natural planktonic ecosystems provided the opportunity for prolonged and detailed investigation of dynamic events within the pelagic system of a known water body. Recent investigations into plankton ecology, using enclosure systems in different marine environments, are discussed in relation to the data obtained from the Nanaimo, British Columbia, Canada, plastic-sphere experiments of 1960 and 1962. Three types of modern enclosure experiments are recognized: floating systems within nutrient levels maintained or running down, and benthic attached systems. The review largely discusses results from the two kinds of floating systems. Processes at several trophic levels have been investigated in enclosures. This review attempts to draw together details from all experimental systems to emphasize the enclosures' contribution to our understanding of planktonic systems. Enclosures made it possible to examine primary production processes, particularly in relation to inorganic nutrient availability and water-column stability. Recent experiments have used the understanding of these processes as a management technique in maintaining different planktonic systems. Relationships between primary and secondary trophic levels are not always easy to interpret, since the growth of primary carnivore populations can often determine the survival of zooplankton populations. Nevertheless, the development of cohorts of herbivorous zooplankton has been followed in several enclosures, yielding useful information on development times and production rates. In enclosed systems it is thus possible to directly relate tertiary level production to inorganic nutrient input, and to calculate production rates and exchange efficiencies at several trophic levels.

Based on a pluridisciplinary approach and a variety of media, this book challenges the view that the English countryside is an apolitical space characterised by permanence and lack of conflict. It analyses how the pastoral motif is actually subverted to explore liminal spaces and temporalities. The authors deconstruct the “rural idyll” myth to show how it plays a distinctive and yet ambiguous part in defining Englishness/Britishness.
