The Chemistry Behind Chalk: Calcium Carbonate

Chalk, in its most common form used in classrooms, is primarily composed of calcium carbonate (CaCO_3). Understanding its chemical formula is the cornerstone of any moles of chalk lab. Calcium carbonate is an ionic compound formed between calcium ions (Ca^{2+}) and carbonate ions (CO_3^{2-}). This compound is relatively insoluble in pure water but reacts readily with acids, a key reaction exploited in many variations of the moles of chalk lab. The purity of the chalk sample is a critical factor in the accuracy of experimental results, as impurities can introduce errors in calculations.

Chemical Formula and Molar Mass of Calcium Carbonate

The chemical formula CaCO_3 tells us that one molecule of calcium carbonate contains one calcium atom, one carbon atom, and three oxygen atoms. To determine the moles of chalk, we first need to calculate its molar mass. This is done by summing the atomic masses of each element present in the compound, using values from the periodic table. The atomic mass of calcium (Ca) is approximately 40.08 g/mol, carbon (C) is approximately 12.01 g/mol, and oxygen (O) is approximately 16.00 g/mol. Therefore, the molar mass of CaCO_3 is calculated as:

- $$(1 \times 40.08 \text{ g/mol}) + (1 \times 12.01 \text{ g/mol}) + (3 \times 16.00 \text{ g/mol}) = 100.09 \text{ g/mol}$$

This molar mass is crucial for converting the mass of chalk used in the lab into moles, a fundamental step in stoichiometric calculations. Any lab procedure involving chalk will rely heavily on this molar mass for accurate mole determinations.

Purity and Impurities in Chalk Samples

While chalk is predominantly calcium carbonate, commercially available chalk can contain various impurities. These might include binders, pigments, or other inert materials that do not participate in the intended chemical reactions. The presence of impurities will affect the measured mass of CaCO_3 and, consequently, the calculated number of moles. For precise results in a moles of chalk lab, it is often beneficial to use a purer form of calcium carbonate, such as precipitated calcium carbonate, if available. Otherwise, understanding the potential impact of impurities on the experimental outcome is essential for data analysis.

The Mole Concept and Its Application in the Lab

The mole is the SI unit for the amount of substance, defined as the number of elementary entities (e.g., atoms, molecules, ions) in a sample equal to the number of atoms in 12 grams of carbon-12. This concept is central to quantitative chemistry and is extensively utilized in a moles of chalk lab to bridge the gap between macroscopic measurements (mass) and microscopic quantities (number of particles).

Defining the Mole and Avogadro's Number

One mole of any substance contains approximately 6.022×10^{23} elementary entities. This constant is known as Avogadro's number. In the context of a moles of chalk lab, this means that 100.09 grams of pure calcium carbonate contains Avogadro's number of CaCO_3 formula units. The ability to convert between mass, moles, and the number of particles is a fundamental skill honed through experiments like the moles of chalk lab.

Calculating Moles from Mass

The most direct application of the mole concept in a moles of chalk lab is the calculation of moles from a measured mass of chalk. The formula used is:

$$\text{moles} = \text{mass (g)} / \text{molar mass (g/mol)}$$

For instance, if you use 10.00 grams of chalk in your experiment, the number of moles of CaCO_3 would be $10.00 \text{ g} / 100.09 \text{ g/mol} \approx 0.0999$ moles. This calculation is performed repeatedly throughout the lab to determine the amount of reactant available or produced.

Common Experiments in a Moles of Chalk Lab

Several types of experiments can be conducted using chalk to teach stoichiometric principles. These often involve reacting chalk with an acid and measuring the amount of gas produced or the amount of unreacted acid remaining. These experiments provide hands-on experience with key chemical concepts.

Reaction of Chalk with Hydrochloric Acid

A common experiment involves reacting calcium carbonate with hydrochloric acid (HCl). The balanced chemical equation for this reaction is:

In this reaction, solid chalk reacts with aqueous hydrochloric acid to produce aqueous calcium chloride, liquid water, and gaseous carbon dioxide. This reaction is exothermic and effervescent, making it visually engaging for students. The moles of chalk lab often focuses on quantifying the amount of carbon dioxide produced or the amount of HCl consumed.

Determining the Moles of CO₂ Produced

One of the most frequent objectives in a moles of chalk lab is to determine the moles of carbon dioxide gas evolved from the reaction. This can be achieved by collecting and measuring the volume of CO₂ gas at a known temperature and pressure, and then using the ideal gas law ($PV = nRT$) to calculate the number of moles (n). Alternatively, if the experiment is conducted in a closed system with a pressure sensor, the pressure change can be correlated to the moles of gas produced. Accurate measurement of the initial mass of chalk and its purity are critical for reliable results.

Titration to Determine Reactant Moles

Another variation of the moles of chalk lab might involve an acid-base titration. After reacting a known mass of chalk with a measured excess of a strong acid (like HCl), the remaining unreacted acid can be titrated with a strong base (like NaOH) to determine how much acid was consumed by the chalk. Knowing the moles of acid consumed allows for the calculation of the moles of chalk that reacted, based on the stoichiometry of the $\text{CaCO}_3 + \text{HCl}$ reaction. This method is valuable for demonstrating quantitative analysis and accuracy in measurement.

Practical Considerations and Potential Challenges

While the concept of moles of chalk lab is straightforward, practical execution can present challenges. Understanding these potential pitfalls can help students achieve more accurate and meaningful results.

Measuring and Weighing Accurately

The accuracy of any mass-based calculation in the moles of chalk lab hinges on precise measurements. Using an electronic balance capable of measuring to at least two decimal places is essential. Inconsistent weighing techniques or using a balance that has not been properly tared can lead to significant errors in the calculated moles of chalk.

Handling of Reagents

Care must be taken when handling acids, especially concentrated hydrochloric acid, which is corrosive. Proper laboratory safety protocols, including wearing safety goggles and gloves, should always be followed. Ensuring the correct concentration of the acid is also important for stoichiometric calculations. If using solutions with unknown concentrations, standardization procedures might be necessary.

Gas Collection and Measurement Errors

If the moles of chalk lab involves measuring the volume of CO_2 gas, errors can arise from incomplete collection, leaks in the apparatus, or inaccurate volume measurements. Temperature and pressure fluctuations during the experiment can also affect gas volume. Ensuring the apparatus is airtight and that measurements are taken under stable conditions is crucial for accurate mole calculations of CO_2 .

Completeness of Reaction

Ensuring that the reaction between chalk and acid goes to completion is vital for accurate results. If the acid is the limiting reactant, not all the chalk will react, and calculations based on the initial mass of chalk will be incorrect. Conversely, if the chalk is the limiting reactant, excess acid will remain, and this needs to be accounted for in titrations. Observing for the cessation of effervescence is a good indicator that the reaction has finished, but longer reaction times might be necessary for complete dissolution of chalk particles.

Interpreting and Analyzing Moles of Chalk Lab Results

Once the experimental data has been collected, the next crucial step is to interpret and analyze the results of the moles of chalk lab. This involves comparing experimental findings with theoretical expectations and understanding the implications of any discrepancies.

Comparing Experimental Moles to Theoretical Moles

A key aspect of the moles of chalk lab is comparing the experimentally determined moles of product (e.g., CO₂) or the moles of reactant consumed to the theoretically calculated moles based on the initial mass of chalk. This comparison allows for the calculation of percent yield or percent error, which are important measures of experimental accuracy. Deviations from theoretical values can highlight areas where experimental errors may have occurred.

Calculating Percent Error and Percent Yield

Percent error quantifies how far an experimental result deviates from the accepted or theoretical value. It is calculated as:

$$\text{Percent Error} = (|\text{Experimental Value} - \text{Theoretical Value}| / \text{Theoretical Value}) \times 100\%$$

Percent yield, typically used when determining the amount of product formed, is calculated as:

$$\text{Percent Yield} = (\text{Actual Yield} / \text{Theoretical Yield}) \times 100\%$$

In a moles of chalk lab, these calculations help students evaluate the success of their experimental procedure and identify potential sources of error. High percent error or low percent yield suggests room for improvement in technique or experimental design.

Identifying Sources of Error

Analyzing the results of a moles of chalk lab involves a critical examination of all steps taken during the experiment. Potential sources of error could include:

- Inaccurate mass measurements of chalk or other reagents.
- Incomplete reaction or side reactions occurring.
- Loss of product during collection or transfer.
- Errors in measuring gas volume, temperature, or pressure.
- Impurities in the chalk sample.
- Titration inaccuracies, such as over-titration or using an incorrect indicator.

By systematically identifying and discussing these potential sources of error, students gain a deeper

understanding of the scientific method and the importance of precision in experimental work.

Beyond the Basic Moles of Chalk Lab

The moles of chalk lab serves as a foundational experiment that can be expanded upon to explore more complex chemical concepts and real-world applications.

Environmental Implications of Carbonate Rocks

Chalk, being a form of calcium carbonate, is abundant in nature as limestone and marble. The dissolution of these carbonate rocks through natural processes, such as the action of acidic rain (rainwater containing dissolved carbon dioxide forming carbonic acid), is a significant geological and environmental phenomenon. Understanding the stoichiometry of reactions like that seen in the moles of chalk lab can help explain weathering processes and their impact on landscapes and infrastructure. The carbon cycle also involves the formation and dissolution of carbonates, making this lab relevant to broader environmental chemistry topics.

Industrial Applications of Calcium Carbonate

Calcium carbonate has numerous industrial uses beyond its role as a classroom learning tool. It is a key component in the production of cement, glass, and paper. It is also used as a filler in plastics, paints, and rubber, and as an antacid in pharmaceuticals. Understanding the moles of chalk lab provides a basic understanding of the quantitative principles that govern these large-scale industrial processes, demonstrating the practical importance of stoichiometry in everyday materials and manufacturing.

Frequently Asked Questions

What is the primary goal of a moles of chalk lab?

The primary goal of a moles of chalk lab is usually to determine the mass of calcium carbonate (CaCO_3) in a sample of chalk by reacting it with a known amount of acid and measuring the amount of carbon dioxide (CO_2) gas produced.

What chemical reaction is typically involved in a moles of chalk lab?

The typical chemical reaction involves the reaction between calcium carbonate (chalk) and an acid, commonly hydrochloric acid (HCl). The balanced chemical equation is: $\text{CaCO}_3(\text{s}) + 2\text{HCl}(\text{aq}) \rightarrow \text{CaCl}_2(\text{aq}) + \text{H}_2\text{O}(\text{l}) + \text{CO}_2(\text{g})$.

How is the amount of carbon dioxide gas usually measured in this lab?

Carbon dioxide gas is often measured by collecting it over water and measuring its volume, or by using a gas syringe to directly capture the evolved CO₂. Alternatively, if the reaction is performed in a closed system with a pressure sensor, the pressure change can be used to infer CO₂ production.

What stoichiometric principles are applied to calculate moles of chalk?

Stoichiometric principles, particularly the mole ratio from the balanced chemical equation, are crucial. Once the moles of CO₂ produced are determined (using the ideal gas law or by measuring its volume), the mole ratio between CaCO₃ and CO₂ (1:1 in this case) is used to find the moles of calcium carbonate that reacted.

What are common sources of error in a moles of chalk lab?

Common sources of error include incomplete reaction of the chalk, loss of CO₂ gas during collection, inaccuracies in measuring the initial mass of chalk or the volume of acid, temperature and pressure variations affecting gas volume, and impurities in the chalk.

Why is it important to use excess acid in the reaction?

Using excess acid ensures that all the calcium carbonate in the chalk sample reacts completely. This makes the carbon dioxide produced directly proportional to the amount of calcium carbonate present, simplifying the calculations and improving accuracy.

How can the percentage purity of the chalk sample be determined?

The percentage purity can be calculated by comparing the experimentally determined mass of calcium carbonate (obtained from the moles of chalk calculated) to the initial mass of the chalk sample. The formula is: $\left(\frac{\text{Mass of CaCO}_3}{\text{Initial Mass of Chalk}}\right) \times 100\%$.

Moles of Chalk Lab: A Comprehensive Guide

Introduction: Unveiling the World of Stoichiometry

Stoichiometry, at its core, is the science of measuring the quantitative relationships between reactants and products in chemical reactions. It's the bridge between the theoretical world of balanced chemical equations and the practical world of laboratory experiments. Understanding stoichiometry is crucial for any aspiring chemist, allowing you to predict the amount of product you can obtain from a given amount of reactant, or conversely, determining the amount of reactant needed to produce a desired amount of product. The "moles of chalk" experiment serves as an excellent introduction to these fundamental principles. Chalk, primarily calcium carbonate (CaCO_3), reacts with hydrochloric acid (HCl) to produce calcium chloride (CaCl_2), carbon dioxide (CO_2), and water (H_2O). This reaction provides a tangible, easily observable example to illustrate the concepts of molar mass, mole ratios, and limiting reactants. This guide will walk you through each stage of the experiment, from preparation to analysis, ensuring a firm grasp of stoichiometry's practical application.

Chapter 1: Pre-Lab Preparations: Laying the Foundation for Success

Before embarking on any experiment, meticulous preparation is crucial. This includes not just gathering the necessary materials but also understanding the inherent safety protocols. Let's outline the key elements of pre-lab preparation for the moles of chalk experiment:

1.1 Gathering Materials:

Chalk: Ensure you have a clean, dry piece of chalk of known mass. Weigh it accurately using an analytical balance, recording the mass in grams.

Hydrochloric Acid (HCl): Use a solution of known concentration (e.g., 1M or 2M HCl). Note the exact concentration. Always handle HCl with care, wearing appropriate safety goggles and gloves.

Erlenmeyer Flask: A flask of appropriate size to comfortably contain the chalk and acid solution.

Beaker: A beaker to collect any excess solution.

Graduated Cylinder: For accurate measurement of the HCl solution.

Analytical Balance: For precise mass measurements of the chalk.

Safety Goggles: Essential for eye protection when handling chemicals.

Gloves: To protect your hands from the corrosive acid.

Bunsen Burner (optional): Depending on the experiment design, you might need a Bunsen burner to heat the reaction.

1.2 Safety Protocols:

Acid Handling: Hydrochloric acid is corrosive. Always add acid to water, never water to acid, to avoid splashing. Wear safety goggles and gloves throughout the procedure.

Ventilation: Perform the experiment in a well-ventilated area to avoid inhaling any released gases.

Waste Disposal: Follow your instructor's guidelines for proper disposal of chemical waste. Do not pour the contents down the drain without proper authorization.

Chapter 2: The Experiment - Step-by-Step Guide to Success

This section details the precise steps involved in conducting the moles of chalk experiment. The exact procedure may vary slightly depending on the specific instructions provided by your instructor, but the fundamental steps remain consistent:

2.1 Procedure:

1. Weigh the Chalk: Accurately weigh the clean, dry piece of chalk using an analytical balance. Record the mass (in grams) in your lab notebook.
2. Measure the HCl: Using a graduated cylinder, accurately measure the required volume of HCl solution of known concentration. Record this volume (in milliliters) in your lab notebook.
3. Add the Chalk to the Flask: Carefully place the weighed chalk into the Erlenmeyer flask.
4. Add the HCl: Slowly add the measured HCl solution to the flask containing the chalk. Observe the reaction carefully – you should see effervescence (bubbling) as carbon dioxide gas is produced.
5. Monitor the Reaction: Continue observing the reaction until the effervescence ceases, indicating that the reaction is complete. You may need to gently swirl the flask.
6. Mass the Residue (Optional): After the reaction, allow the solution to settle. If instructed, filter the solution to remove any undissolved solids and then dry the residue (any remaining chalk). Weigh the residue to calculate the amount of chalk that reacted.

Chapter 3: Data Collection and Analysis - Extracting Meaning from Measurements

Accurate data collection and analysis are the cornerstones of a successful experiment. For the moles of chalk experiment, this involves meticulously recording all measurements and performing the necessary calculations.

3.1 Data Collection:

Mass of Chalk (initial): Record the initial mass of the chalk before the reaction (grams).

Volume of HCl: Record the volume of HCl solution used (milliliters).

Concentration of HCl: Record the molar concentration of the HCl solution (mol/L).

Mass of Residue (if applicable): Record the mass of any remaining chalk after the reaction (grams).

Observations: Note any qualitative observations during the reaction, such as the rate of effervescence or any color changes.

3.2 Data Analysis:

1. Calculate Moles of HCl: Use the volume and concentration of HCl to calculate the number of moles of HCl used. (Moles = Concentration $\times$ Volume (in Liters))
2. Calculate Moles of CaCO₃: Using the balanced chemical equation for the reaction ($\text{CaCO}_3 + 2\text{HCl} \rightarrow \text{CaCl}_2 + \text{CO}_2 + \text{H}_2\text{O}$), determine the mole ratio between HCl and CaCO₃. Use this ratio to calculate the number of moles of CaCO₃ that reacted.
3. Calculate Molar Mass of CaCO₃ (if needed): If you need to calculate the molar mass of CaCO₃, add up the atomic masses of each element (Ca, C, and O) from the periodic table.

4. Calculate Theoretical Yield (if needed): Based on the number of moles of CaCO_3 , calculate the theoretical mass of CaCO_3 .
5. Calculate Percentage Yield (if needed): Compare the theoretical yield with the actual amount of CaCO_3 that reacted.

Chapter 4: Understanding Your Results: Drawing Conclusions & Identifying Discrepancies

This crucial stage involves interpreting your data within the context of stoichiometry. Analyze the calculated values, compare them to theoretical expectations, and critically examine potential sources of error. For example, if your percentage yield is significantly lower than 100%, what factors could have contributed to this? Some potential sources of error include:

Incomplete Reaction: The reaction might not have gone to completion due to insufficient reaction time or incomplete mixing.

Impurities in the Chalk: The chalk sample might contain impurities that did not react with the HCl.

Measurement Errors: Inaccurate measurements of the chalk mass or HCl volume could lead to errors in calculations.

Loss of CO_2 : Some CO_2 gas might have escaped before it could be collected and measured.

Chapter 5: Writing the Lab Report - Communicating Your Findings Effectively

A well-structured lab report is essential for effectively communicating your findings. Your report should include the following sections:

Title: A concise and descriptive title reflecting the experiment's purpose.

Abstract: A brief summary of the experiment's purpose, procedure, results, and conclusions.

Introduction: Background information on stoichiometry and the purpose of the experiment.

Materials and Methods: A detailed description of the materials used and the experimental procedure followed.

Results: A clear presentation of the collected data, including tables and graphs where appropriate.

Discussion: Interpretation of the results, analysis of potential errors, and comparison with theoretical expectations.

Conclusion: A summary of the key findings and their significance.

Conclusion: Mastering Stoichiometry Through Practical Application

moles of chalk lab: Someone Is Out to Get Us Brian Brown, 2019-11-05 From UFOs to Dr. Strangelove, LSD experiments to Richard Nixon, author Brian Brown investigates the paranoid, panicked history of the Cold War. In *Someone Is Out to Get Us*, Brian T. Brown explores the

delusions, absurdities, and best-kept secrets of the Cold War, during which the United States fought an enemy of its own making for over forty years -- and nearly scared itself to death in the process. The nation chose to fear a chimera, a rotting communist empire that couldn't even feed itself, only for it to be revealed that what lay behind the Iron Curtain was only a sad Potemkin village. In fact, one of the greatest threats to our national security may have been our closest ally. The most effective spy cell the Soviets ever had was made up of aristocratic Englishmen schooled at Cambridge. Establishing a communist peril but lacking proof, J. Edgar Hoover became our Big Brother, and Joseph McCarthy went hunting for witches. Richard Nixon stepped into the spotlight as an opportunistic, ruthless Cold Warrior; his criminal cover-up during a dark presidency was exposed by a Deep Throat in a parking garage. *Someone Is Out to Get Us* is the true and complete account of a long-misunderstood period of history during which lies, conspiracies, and paranoia led Americans into a state of madness and misunderstanding, too distracted by fictions to realize that the real enemy was looking back at them in the mirror the whole time.

moles of chalk lab: *Lab Manual for Chemistry: Atoms First* John W Sibert, Gregg Dieckmann, 2014-01-13 Laboratory Manual to Accompany Chemistry: Atoms First by Gregg Dieckmann and John Sibert from the University of Texas at Dallas. This laboratory manual presents a lab curriculum that is organised around an atoms-first approach to general chemistry. The philosophy behind this manual is to (1) provide engaging experiments that tap into student curiosity, (2) emphasize topics that students find challenging in the general chemistry lecture course, and (3) create a laboratory environment that encourages students to “solve puzzles” or “play” with course content and not just “follow recipes.” The laboratory manual represents a terrific opportunity to get students turned on to science while creating an environment that connects the relevance of the experiments to a greater understanding of their world. This manual has been written to provide instructors with tools that engage students, while providing important connections to the material covered in an atoms-first lecture course.

moles of chalk lab: *Science Research Writing: For Native And Non-native Speakers Of English (Second Edition)* Hilary Glasman-deal, 2020-11-27 This book enables STEMM researchers to write effective papers for publication as well as other research-related texts such as a doctoral thesis, technical report, or conference abstract. Science Research Writing uses a reverse-engineering approach to writing developed from extensive work with STEMM researchers at Imperial College London. This approach unpacks current models of STEMM research writing and helps writers to generate the writing tools needed to operate those models effectively in their own field. The reverse-engineering approach also ensures that writers develop future-proof strategies that will evolve alongside the coming changes in research communication platforms. The Second Edition has been extensively revised and updated to represent current practice and focuses on the writing needs of both early-stage doctoral STEMM researchers and experienced professional researchers at the highest level, whether or not they are native speakers of English. The book retains the practical, user-friendly format of the First Edition, and now contains seven units that deal separately with the components of written STEMM research communication: Introduction, Methods, Results, Discussion, Conclusion, Abstract and Title, as well as extensive FAQ responses and a new Checklist and Tips section. Each unit analyses extracts from recent published STEMM journal papers to enable researchers to discover not only what to write, but, crucially, how to write it. The global nature of science research requires fast, accurate communication of highly complex information that can be understood by all participants. Like the First Edition, the Second Edition is intended as a fast, do-it-yourself guide to make both the process and the product of STEMM research writing more effective. Related Link(s)

moles of chalk lab: The Immortal Life of Henrietta Lacks Rebecca Skloot, 2010-02-02 #1 NEW YORK TIMES BESTSELLER • “The story of modern medicine and bioethics—and, indeed, race relations—is refracted beautifully, and movingly.”—Entertainment Weekly NOW A MAJOR MOTION PICTURE FROM HBO® STARRING OPRAH WINFREY AND ROSE BYRNE • ONE OF THE “MOST INFLUENTIAL” (CNN), “DEFINING” (LITHUB), AND “BEST” (THE PHILADELPHIA INQUIRER) BOOKS OF THE DECADE • ONE OF ESSENCE’S 50 MOST IMPACTFUL BLACK BOOKS OF THE PAST 50 YEARS • WINNER OF THE CHICAGO TRIBUNE HEARTLAND PRIZE FOR NONFICTION NAMED ONE OF THE BEST BOOKS OF THE YEAR BY The New York Times Book Review • Entertainment Weekly • O: The Oprah Magazine • NPR • Financial Times • New York • Independent (U.K.) • Times (U.K.) • Publishers Weekly • Library Journal • Kirkus Reviews • Booklist • Globe and Mail Her name was Henrietta Lacks, but scientists know her as HeLa. She was a poor Southern tobacco farmer who worked the same land as her slave ancestors, yet her cells—taken without her

knowledge—became one of the most important tools in medicine: The first “immortal” human cells grown in culture, which are still alive today, though she has been dead for more than sixty years. HeLa cells were vital for developing the polio vaccine; uncovered secrets of cancer, viruses, and the atom bomb’s effects; helped lead to important advances like in vitro fertilization, cloning, and gene mapping; and have been bought and sold by the billions. Yet Henrietta Lacks remains virtually unknown, buried in an unmarked grave. Henrietta’s family did not learn of her “immortality” until more than twenty years after her death, when scientists investigating HeLa began using her husband and children in research without informed consent. And though the cells had launched a multimillion-dollar industry that sells human biological materials, her family never saw any of the profits. As Rebecca Skloot so brilliantly shows, the story of the Lacks family—past and present—is inextricably connected to the dark history of experimentation on African Americans, the birth of bioethics, and the legal battles over whether we control the stuff we are made of. Over the decade it took to uncover this story, Rebecca became enmeshed in the lives of the Lacks family—especially Henrietta’s daughter Deborah. Deborah was consumed with questions: Had scientists cloned her mother? Had they killed her to harvest her cells? And if her mother was so important to medicine, why couldn’t her children afford health insurance? Intimate in feeling, astonishing in scope, and impossible to put down, *The Immortal Life of Henrietta Lacks* captures the beauty and drama of scientific discovery, as well as its human consequences.

moles of chalk lab: *The Circle* Dave Eggers, 2013-10-08 INTERNATIONAL BESTSELLER • A bestselling dystopian novel that tackles surveillance, privacy and the frightening intrusions of technology in our lives—a “compulsively readable parable for the 21st century” (Vanity Fair). When Mae Holland is hired to work for the Circle, the world’s most powerful internet company, she feels she’s been given the opportunity of a lifetime. The Circle, run out of a sprawling California campus, links users’ personal emails, social media, banking, and purchasing with their universal operating system, resulting in one online identity and a new age of civility and transparency. As Mae tours the open-plan office spaces, the towering glass dining facilities, the cozy dorms for those who spend nights at work, she is thrilled with the company’s modernity and activity. There are parties that last through the night, there are famous musicians playing on the lawn, there are athletic activities and clubs and brunches, and even an aquarium of rare fish retrieved from the Marianas Trench by the CEO. Mae can’t believe her luck, her great fortune to work for the most influential company in the world—even as life beyond the campus grows distant, even as a strange encounter with a colleague leaves her shaken, even as her role at the Circle becomes increasingly public. What begins as the captivating story of one woman’s ambition and idealism soon becomes a heart-racing novel of suspense, raising questions about memory, history, privacy, democracy, and the limits of human knowledge.
