Overview of the NYS Biodiversity Lab

The NYS Biodiversity Lab is a state-supported scientific institution dedicated to the comprehensive study of biological diversity across New York State's varied habitats. Its primary objective is to document the variety of plant, animal, and microbial life to better understand ecosystem dynamics and species interactions. The lab integrates classical taxonomy with modern genetic tools to provide accurate species identification and population assessments. Located within a larger network of environmental and academic organizations, the facility serves as a hub for biodiversity research that informs management and conservation strategies statewide.

Mission and Vision

The mission of the NYS Biodiversity Lab is to advance knowledge about the state's natural heritage and promote sustainable ecosystem management through rigorous scientific inquiry. The lab envisions a future where biodiversity is preserved amid changing environmental conditions, ensuring resilient ecosystems that support both wildlife and human communities. By fostering partnerships with government agencies, universities, and conservation groups, the lab aims to bridge science and policy for effective biodiversity stewardship.

Facilities and Resources

The lab is equipped with state-of-the-art instruments including DNA sequencers, microscopy suites, and bioinformatics workstations. These resources enable precise molecular analyses and data processing essential for large-scale biodiversity assessments. Additionally, the lab maintains extensive specimen collections and databases that serve as reference points for ongoing and future research. Field stations and sampling equipment complement laboratory capabilities, facilitating comprehensive ecosystem monitoring throughout New York State.

Research and Analytical Techniques

Research at the NYS Biodiversity Lab employs a multidisciplinary approach combining fieldwork, molecular biology, and computational analysis. This integration allows for detailed investigations into species distribution, genetic diversity, and ecological interactions. The lab prioritizes cutting-edge methodologies to enhance the accuracy and efficiency of biodiversity assessments.

Molecular and Genetic Analysis

DNA barcoding and genomic sequencing are core techniques used at the lab to identify species and assess genetic variation within populations. These molecular tools help detect cryptic species and monitor genetic health, which are crucial for conservation planning. Environmental DNA (eDNA) sampling is also utilized to non-invasively detect species presence in aquatic and terrestrial habitats, broadening the scope of biodiversity surveys.

Ecological Monitoring and Data Collection

The lab conducts systematic field surveys using standardized protocols to collect data on species abundance, habitat conditions, and ecological interactions. Remote sensing technologies and geographic information systems (GIS) support habitat mapping and landscape-level analyses. Long-term monitoring programs track changes in biodiversity indicators, providing insights into the effects of climate change, habitat fragmentation, and invasive species.

Bioinformatics and Data Management

Advanced bioinformatics pipelines process large datasets generated from genetic and ecological studies. The lab employs statistical modeling and machine learning to interpret complex biodiversity patterns and predict future trends. Data management systems ensure secure storage, accessibility, and integration of biological information for research and policy applications.

Key Projects and Collaborations

The NYS Biodiversity Lab leads and participates in numerous projects that address critical conservation questions and promote ecological resilience. Collaborative efforts with academic institutions, government bodies, and non-profit organizations amplify the impact of its research.

The lab plays an active role in monitoring invasive species that threaten native biodiversity. By identifying invasion pathways and assessing ecological impacts, the lab informs management strategies aimed at controlling or eradicating harmful non-native species. Collaborative outreach programs raise public awareness about preventing the spread of invasives.

Climate Change Impact Studies

Research on how climate change affects species distribution and ecosystem processes is a priority for the lab. Through modeling and empirical data, the lab evaluates vulnerability and adaptive capacity of various species and habitats. These findings support the development of climate-resilient conservation policies and restoration efforts.

Impact on Conservation and Policy

nys biodiversity lab: **A Framework for K-12 Science Education** National Research Council, Division of Behavioral and Social Sciences and Education, Board on Science Education, Committee on a Conceptual Framework for New K-12 Science Education Standards, 2012-02-28 Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

How is this happening? Menno Schilthuizen is one of a growing number of "urban ecologists" studying how our manmade environments are accelerating and changing the evolution of the animals and plants around us. In Darwin Comes to Town, he takes us around the world for an up-close look at just how stunningly flexible and swift-moving natural selection can be. With human populations growing, we're having an increasing impact on global ecosystems, and nowhere do these impacts overlap as much as they do in cities. The urban environment is about as extreme as it gets, and the wild animals and plants that live side-by-side with us need to adapt to a whole suite of challenging conditions: they must manage in the city's hotter climate (the "urban heat island"); they need to be able to live either in the semidesert of the tall, rocky, and cavernous structures we call buildings or in the pocket-like oases of city parks (which pose their own dangers, including smog and free-ranging dogs and cats); traffic causes continuous noise, a mist of fine dust particles, and barriers to movement for any animal that cannot fly or burrow; food sources are mainly human-derived. And yet, as Schilthuizen shows, the wildlife sharing these spaces with us is not just surviving, but evolving ways of thriving. Darwin Comes to Town draws on eye-popping examples of adaptation to share a stunning vision of urban evolution in which humans and wildlife co-exist in a unique harmony. It reveals that evolution can happen far more rapidly than Darwin dreamed, while providing a glimmer of hope that our race toward over population might not take the rest of nature down with us.

nys biodiversity lab: *Plant-derived Natural Products* Anne E. Osbourn, Virginia Lanzotti, 2009-07-07 Plants produce a huge array of natural products (secondary metabolites). These compounds have important ecological functions, providing protection against attack by herbivores

and microbes and serving as attractants for pollinators and seed-dispersing agents. They may also contribute to competition and invasiveness by suppressing the growth of neighboring plant species (a phenomenon known as allelopathy). Humans exploit natural products as sources of drugs, flavoring agents, fragrances and for a wide range of other applications. Rapid progress has been made in recent years in understanding natural product synthesis, regulation and function and the evolution of metabolic diversity. It is timely to bring this information together with contemporary advances in chemistry, plant biology, ecology, agronomy and human health to provide a comprehensive guide to plant-derived natural products. Plant-derived natural products: synthesis, function and application provides an informative and accessible overview of the different facets of the field, ranging from an introduction to the different classes of natural products through developments in natural product chemistry and biology to ecological interactions and the significance of plant-derived natural products for humans. In the final section of the book a series of chapters on new trends covers metabolic engineering, genome-wide approaches, the metabolic consequences of genetic modification, developments in traditional medicines and nutraceuticals, natural products as leads for drug discovery and novel non-food crops.

Marine epidemics can cause mass die-offs of wildlife from the bottom to the top of food chains, impacting the health of ocean ecosystems as well as lives on land. Portending global environmental disaster, ocean outbreaks are fueled by warming seas, sewage dumping, unregulated aquaculture, and drifting plastic. Ocean Outbreak follows renowned scientist Drew Harvell and her colleagues into the field as they investigate how four iconic marine animals—corals, abalone, salmon, and starfish—have been devastated by disease. Based on over twenty years of research, this firsthand account of the sometimes gradual, sometimes exploding impact of disease on our ocean's biodiversity ends with solutions and a call to action. Only through policy changes and the implementation of innovative solutions from nature can we reduce major outbreaks, save some ocean ecosystems, and protect our fragile environment.

Many habitats have been completely destroyed or divided into tiny fragments, others have been transformed through the introduction of new species, or the extinction of native plants and animals, while anthropogenic climate change now threatens to completely redraw the geographic map of life on this planet. The urgent need to understand and prescribe solutions to this complicated and interlinked set of pressing conservation issues has led to the transformation of the venerable academic discipline of biogeography - the study of the geographic distribution of animals and plants. The newly emerged sub-discipline of conservation biogeography uses the conceptual tools and methods of biogeography to address real world conservation problems and to provide predictions about the fate of key species and ecosystems over the next century. This book provides the first comprehensive review of the field in a series of closely interlinked chapters addressing the central issues within this exciting and important subject.

nys biodiversity lab: **A Sea of Glass** Drew Harvell, 2016-05-17 The author makes an eloquent plea for marine biodiversity conservation.—Library Journal Harvell seems to channel the devotion that motivated the Blaschkas.—The Guardian Winner of the 2016 National Outdoor Book Award, Environment Category It started with a glass octopus. Dusty, broken, and all but forgotten, it caught Drew Harvell's eye. Fashioned in intricate detail by the father-son glassmaking team of Leopold and Rudolf Blaschka, the octopus belonged to a menagerie of unusual marine creatures that had been packed away for decades in a storage unit. More than 150 years earlier, the Blaschkas had been captivated by marine invertebrates and spun their likenesses into glass, documenting the life of oceans untouched by climate change and human impacts. Inspired by the Blaschkas' uncanny replicas, Harvell set out in search of their living counterparts. In *A Sea of Glass*, she recounts this journey of a lifetime, taking readers along as she dives beneath the ocean's surface to a rarely seen world, revealing the surprising and unusual biology of some of the most ancient animals on the tree of life. On the way, we glimpse a century of change in our ocean ecosystems and learn which of the living matches for the Blaschkas' creations are, indeed, as fragile as glass. Drew Harvell and the Blaschka menagerie are the subjects of the documentary *Fragile Legacy*, which won the Best Short Film award at the 2015 Blue Ocean Film Festival & Conservation Summit. nys biodiversity lab: Freshwater Biodiversity David Dudgeon, 2020-05-21 Growing human populations and higher demands for water impose increasing impacts and stresses upon freshwater biodiversity. Their combined effects have made these animals more endangered than their terrestrial and marine counterparts. Overuse and contamination of water, overexploitation and overfishing,

introduction of alien species, and alteration of natural flow regimes have led to a 'great thinning' and declines in abundance of freshwater animals, a 'great shrinking' in body size with reductions in large species, and a 'great mixing' whereby the spread of introduced species has tended to homogenize previously dissimilar communities in different parts of the world. Climate change and warming temperatures will alter global water availability, and exacerbate the other threat factors. What conservation action is needed to halt or reverse these trends, and preserve freshwater biodiversity in a rapidly changing world? This book offers the tools and approaches that can be deployed to help conserve freshwater biodiversity.

nys biodiversity lab: Infectious Disease Ecology Richard S. Ostfeld, Felicia Keesing, Valerie T. Eviner, 2010-12-16 News headlines are forever reporting diseases that take huge tolls on humans, wildlife, domestic animals, and both cultivated and native plants worldwide. These diseases can also completely transform the ecosystems that feed us and provide us with other critical benefits, from flood control to water purification. And yet diseases sometimes serve to maintain the structure and function of the ecosystems on which humans depend. Gathering thirteen essays by forty leading experts who convened at the Cary Conference at the Institute of Ecosystem Studies in 2005, this book develops an integrated framework for understanding where these diseases come from, what ecological factors influence their impacts, and how they in turn influence ecosystem dynamics. It marks the first comprehensive and in-depth exploration of the rich and complex linkages between ecology and disease, and provides conceptual underpinnings to understand and ameliorate epidemics. It also sheds light on the roles that diseases play in ecosystems, bringing vital new insights to landscape management issues in particular. While the ecological context is a key piece of the puzzle, effective control and understanding of diseases requires the interaction of professionals in medicine, epidemiology, veterinary medicine, forestry, agriculture, and ecology. The essential resource on the subject, Infectious Disease Ecology seeks to bridge these fields with an ecological approach that focuses on systems thinking and complex interactions.

nys biodiversity lab: The Wild Turkey James G. Dickson, 1992 A National Wild Turkey Federation and U.S. Forest Service book Standard reference for all subspecies Extensive, new information on all aspects of wild turkey ecology and management The standard reference for all subspecies--Eastern, Gould's, Merriam's, Florida and Rio Grande--The Wild Turkey summarizes the new technologies and studies leading to better understanding and management. Synthesizing the work of all current experts, The Wild Turkey presents extensive, new data on restoration techniques; population influences and management; physical characteristics and behavior; habitat use by season, sex, and age; historic and seasonal ranges and habitat types; and nesting ecology. The book is designed to further the already incredible comeback of America's wild turkey.

nys biodiversity lab: Molecular Approaches to Crop Improvement Elizabeth S. Dennis, Danny J. Llewellyn, 2012-12-06 Although plant genes were first isolated only some twelve years ago and transfer of foreign DNA into tobacco cells first demonstrated some eight years ago, the application and extension of biotechnology to agricultural problems has already led to the field-testing of genetically modified crop plants. The promise of tailor-made plants containing resistance to pests or diseases as well as many other desirable characteristics has led to the almost compulsory incorporation of molecular biology into the research programs of chemical and seed companies as well as Governmental agricultural agencies. With the routine transformation of rice and the early evidence of transformation of maize the possibility of the world's major cereal crops being modified for improved nutritional value or resistance characteristics is now likely in the next few years. The increasing number of cloned plant genes and the increasing sophistication of our knowledge of the major developmental and biochemical pathways in plants should eventually allow us to engineer crop plants with higher yields and with less detrimental impact on the environment than now occurs in our current high input agricultural systems. This book draws together many of the expanding areas of plant molecular biology and genetic engineering that will make a substantial contribution to the development of the more productive and efficient crop plants that the world's farmers will be planting in the next decade.

nys biodiversity lab: The Living Landscape Rick Darke, Douglas W. Tallamy, 2016-02-04 "This thoughtful, intelligent book is all about connectivity, addressing a natural world in which we are the primary influence." —The New York Times Books Review Many gardeners today want a home landscape that nourishes and fosters wildlife, but they also want beauty, a space for the kids to play, privacy, and maybe even a vegetable patch. Sure, it's a tall order, but *The Living Landscape* shows you how to do it. You'll learn the strategies for making and maintaining a diverse, layered landscape—one that offers beauty on many levels, provides outdoor rooms and turf areas for children and pets, incorporates fragrance and edible plants, and provides cover, shelter, and sustenance for wildlife. Richly illustrated and informed by both a keen eye for design and an understanding of how healthy ecologies work, *The Living Landscape* will enable you to create a garden that fulfills both human needs and the needs of wildlife communities.

nys biodiversity lab: The Botany of Desire Michael Pollan, 2002-05-28 "Pollan shines a light on our own nature as well as on our implication in the natural world." —The New York Times "A wry, informed pastoral." —The New Yorker The book that helped make Michael Pollan, the New York Times bestselling author of *How to Change Your Mind*, *Cooked* and *The Omnivore's Dilemma*, one of the most trusted food experts in America Every schoolchild learns about the mutually beneficial dance of honeybees and flowers: The bee collects nectar and pollen to make honey and, in the process, spreads the flowers' genes far and wide. In *The Botany of Desire*, Michael Pollan ingeniously demonstrates how people and domesticated plants have formed a similarly reciprocal relationship. He masterfully links four fundamental human desires—sweetness, beauty, intoxication, and control—with the plants that satisfy them: the apple, the tulip, marijuana, and the potato. In telling the stories of four familiar species, Pollan illustrates how the plants have evolved to satisfy humankind's most basic yearnings. And just as we've benefited from these plants, we have also done well by them. So who is really domesticating whom?

nys biodiversity lab: Mediterranean-Type Ecosystems George W. Davis, David M. Richardson, 2012-12-06 Human activities are causing species extinctions at a rate and magnitude rivaling those of past geologic extinction events. Exploring mediterranean-type ecosystems - the Mediterranean Basin, California, Chile, Australia, and South Africa - this volume addresses the question whether biological diversity plays a significant role in the functioning of natural ecosystems, and to what extent that diversity can be reduced without causing system malfunction. Comparative studies in ecosystems that are similar in certain respects, but differ in others, offer considerable scope for gaining new insights into the links between biodiversity and ecosystem functioning.
