Chapter 2: Chemical Hazard Identification and Classification: Understanding the GHS

Accurately identifying and classifying chemical hazards is paramount to effective hazard communication. This chapter delves into the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), a globally recognized system designed to standardize the classification of chemicals and their associated hazards. Understanding the GHS is crucial for compliance with OSHA's Hazard Communication Standard (HCS). The GHS utilizes a standardized approach to:

2.1 Hazard Classification

The GHS outlines specific criteria for classifying chemicals based on their physical, health, and environmental hazards. This involves assigning hazard classes such as flammability, toxicity, corrosivity, and carcinogenicity. Each hazard class has specific criteria that must be met for a chemical to be classified within that class. This section will explore each hazard class in detail, providing specific examples and clarifying the criteria for classification.

2.2 GHS Pictograms and Signal Words

The GHS employs standardized pictograms, signal words, hazard statements, and precautionary statements to communicate hazard information clearly and consistently. This section provides detailed explanations of each element, providing visual aids and practical examples. Understanding these elements is crucial for proper interpretation of chemical labels and Safety Data Sheets (SDS).

(This structure should be replicated for all chapters, using relevant keywords and subheadings throughout.)

Many of the key determinants and solutions to environmental health problems lie outside the direct realm of health and are strongly dependent on environmental changes, water and sanitation, industrial development, education, employment, trade, tourism, agriculture, urbanization, energy, housing and national security. Environmental risks, vulnerability and variability manifest themselves in different ways and at different time scales. While there are shared global and transnational problems, each community, country or region faces its own unique environmental health problems, the solution of which depends on circumstances surrounding the resources, customs, institutions, values and environmental vulnerability. This work contains critical reviews and assessments of environmental health practices and research that have worked in places and thus can guide programs and economic development in other countries or regions. The Encyclopedia of Environmental Health, Five Volume Set seeks to conceptualize the subject more clearly, to describe the best available scientific methods that can be used in characterizing and managing environmental health risks, to extend the field of environmental health through new theoretical perspectives and heightened appreciation of social, economic and political contexts, and to encourage a richer analysis in the field through examples of diverse experiences in dealing with the health-environment interface. The Encyclopedia of Environmental Health contains numerous examples of policy options and environmental health practices that have worked and thus can guide programs in other countries or regions It includes a wide range of tools and strategies that can assist communities and countries in assessing environmental health conditions, monitoring progress of intervention implementation and evaluating outcomes Provides a comprehensive overview of existing knowledge in this emerging field Articles contain summaries and assessments of environmental health practices and research, providing a framework for further research Places environmental health in the broader context of environmental change and related ecological, political, economic, social, and cultural issues
