The design of the Packard precision drill press emphasizes ruggedness and precision. The machine typically features a cast iron table that can be adjusted vertically and rotated for angled drilling. The spindle and motor assembly are engineered to deliver smooth and consistent power, avoiding backlash and ensuring precise hole placement. The drill press often includes a quill feed lever and depth stop for repeatable drilling depths, essential for precision work.

Key Features and Specifications

The Packard precision drill press is equipped with a range of features that support its reputation for accuracy and reliability. Understanding these specifications helps users select the right model and optimize its use in various applications.

Motor and Speed Settings

Most Packard drill press models come with variable speed motors, allowing operators to adjust spindle speed according to the material and drill bit size. Typical speed ranges vary from 250 RPM to 3,600 RPM, providing versatility for drilling through softwoods, hardwoods, and metals. The variable speed feature is often controlled by a belt and pulley system or an electronic variable frequency drive, depending on the model.

Table Size and Adjustability

The drill press table is a critical component that supports the workpiece during drilling. Packard drill presses usually feature tables that are large enough to accommodate various project sizes. The tables can be tilted up to 45 degrees for angled drilling and can be raised or lowered on the column to suit different drill bit lengths and workpiece thicknesses.

Spindle Travel and Chuck Capacity

Spindle travel indicates how far the spindle can move downwards, affecting the maximum drilling depth. Packard drill presses generally offer spindle

travel in the range of 3 to 6 inches. Chuck capacities vary but commonly accept drill bits from 1/32 inch up to 5/8 inch or more, allowing for a wide variety of drilling operations.

Additional Features

- Quill feed lever with ergonomic design for precise control

Is it fitting that, on the 200th anniversary of that expedition, the United States, together with international partners, should embark on another journey of exploration in a vastly more extensive region of remarkable potential for discovery. Although the oceans cover more than 70 percent of our planet's surface, much of the ocean has been investigated in only a cursory sense, and many areas have not been investigated at all. Exploration of the Seas assesses the feasibility and potential value of

implementing a major, coordinated, international program of ocean exploration and discovery. The study committee surveys national and international ocean programs and strategies for cooperation between governments, institutions, and ocean scientists and explorers, identifying strengths, weaknesses, and gaps in these activities. Based primarily on existing documents, the committee summarizes priority areas for ocean research and exploration and examines existing plans for advancing ocean exploration and knowledge.
