byu geometry part 1 final exam: Empire of Dogs Aaron Skabelund, 2011-12-15 In 1924, Professor Ueno Eizaburo of Tokyo Imperial University adopted an Akita puppy he named Hachiko. Each evening Hachiko greeted Ueno on his return to Shibuya Station. In May 1925 Ueno died while giving a lecture. Every day for over nine years the Akita waited at Shibuya Station, eventually becoming nationally and even internationally famous for his purported loyalty. A year before his death in 1935, the city of Tokyo erected a statue of Hachiko outside the station. The story of Hachiko reveals much about the place of dogs in Japan's cultural imagination. In the groundbreaking *Empire of Dogs*, Aaron Herald Skabelund examines the history and cultural significance of dogs in nineteenth- and twentieth-century Japan, beginning with the arrival of Western dog breeds and new modes of dog keeping, which spread throughout the world with Western imperialism. He highlights how dogs joined with humans to create the modern imperial world and how, in turn, imperialism shaped dogs' bodies and their relationship with humans through its impact on dog-breeding and dog-keeping practices that pervade much of the world today. In a book that is both enlightening and entertaining, Skabelund focuses on actual and metaphorical dogs in a variety of contexts: the rhetorical pairing of the Western colonial dog with native canines; subsequent campaigns against indigenous canines in the imperial realm; the creation, maintenance, and in some cases restoration of Japanese dog breeds, including the Shiba Inu; the mobilization of military dogs, both real and fictional; and the emergence of Japan as a pet superpower in the second half of the twentieth century. Through this provocative account, Skabelund demonstrates how animals generally and canines specifically have contributed to the creation of our shared history, and how certain dogs have subtly influenced how that history is told. Generously illustrated with both color and black-and-white images, *Empire of Dogs* shows that human-canine relations often expose how people—especially those with power and wealth—use animals to define, regulate, and enforce political and social boundaries between themselves and other humans, especially in imperial contexts.

byu geometry part 1 final exam: Google Earth Engine Applications Lalit Kumar, Onesimo Mutanga, 2019-04-23 In a rapidly changing world, there is an ever-increasing need to monitor the Earth's resources and manage it sustainably for future generations. Earth observation from satellites is critical to provide information required for informed and timely decision making in this regard. Satellite-based earth observation has advanced rapidly over the last 50 years, and there is a plethora of satellite sensors imaging the Earth at finer spatial and spectral resolutions as well as high temporal resolutions. The amount of data available for any single location on the Earth is now at the petabyte-scale. An ever-increasing capacity and computing power is needed to handle such large datasets. The Google Earth Engine (GEE) is a cloud-based computing platform that was established by Google to support such data processing. This facility allows for the storage, processing and analysis of spatial data using centralized high-power computing resources, allowing scientists, researchers, hobbyists and anyone else interested in such fields to mine this data and understand the changes occurring on the Earth's surface. This book presents research that applies the Google Earth Engine in mining, storing, retrieving and processing spatial data for a variety of applications that include vegetation monitoring, cropland mapping, ecosystem assessment, and gross primary productivity, among others. Datasets used range from coarse spatial resolution data, such as MODIS, to medium resolution datasets (Worldview -2), and the studies cover the entire globe at varying spatial and temporal scales.

Stauffer, 2000 The authors' new approach to learning two playing techniques offers a systematic method for mastering the modern, legato technique needed for organ music composed after 1750, as well as an articulated technique for earlier works. The authors also present useful information on accompanying anthems and solos and on adapting piano and orchestral accompaniments to the organ.

byu geometry part 1 final exam: In Defense of a Liberal Education Fareed Zakaria, 2015-03-30 CNN host and best-selling author Fareed Zakaria argues for a renewed commitment to the world's most valuable educational tradition. The liberal arts are under attack. The governors of Florida, Texas, and North Carolina have all pledged that they will not spend taxpayer money subsidizing the liberal arts, and they seem to have an unlikely ally in President Obama. While at a General Electric plant in early 2014, Obama remarked, I promise you, folks can make a lot more, potentially, with skilled manufacturing or the trades than they might with an art history degree. These messages are hitting home: majors like English and history, once very popular and highly respected, are in steep decline. I get it, writes Fareed Zakaria, recalling the atmosphere in India

where he grew up, which was even more obsessed with getting a skills-based education. However, the CNN host and best-selling author explains why this widely held view is mistaken and shortsighted. Zakaria eloquently expounds on the virtues of a liberal arts education—how to write clearly, how to express yourself convincingly, and how to think analytically. He turns our leaders' vocational argument on its head. American routine manufacturing jobs continue to get automated or outsourced, and specific vocational knowledge is often outdated within a few years. Engineering is a great profession, but key value-added skills you will also need are creativity, lateral thinking, design, communication, storytelling, and, more than anything, the ability to continually learn and enjoy learning—precisely the gifts of a liberal education. Zakaria argues that technology is transforming education, opening up access to the best courses and classes in a vast variety of subjects for millions around the world. We are at the dawn of the greatest expansion of the idea of a liberal education in human history.

byu geometry part 1 final exam: Introduction to Plasma Physics and Controlled Fusion Francis F. Chen, 2013-03-09 TO THE SECOND EDITION In the nine years since this book was first written, rapid progress has been made scientifically in nuclear fusion, space physics, and nonlinear plasma theory. At the same time, the energy shortage on the one hand and the exploration of Jupiter and Saturn on the other have increased the national awareness of the important applications of plasma physics to energy production and to the understanding of our space environment. In magnetic confinement fusion, this period has seen the attainment 13 of a Lawson number nTE of $2 \times 10 \text{ cm}^{-3} \text{ sec}$ in the Alcator tokamaks at MIT; neutral-beam heating of the PL T tokamak at Princeton to $KT_i = 6.5 \text{ keV}$; increase of average β to 3%-5% in tokamaks at Oak Ridge and General Atomic; and the stabilization of mirror-confined plasmas at Livermore, together with injection of ion current to near field-reversal conditions in the 2XII β device. Invention of the tandem mirror has given magnetic confinement a new and exciting dimension. New ideas have emerged, such as the compact torus, surface-field devices, and the E β T mirror-torus hybrid, and some old ideas, such as the stellarator and the reversed-field pinch, have been revived. Radiofrequency heating has become a new star with its promise of dc current drive. Perhaps most importantly, great progress has been made in the understanding of the MHD behavior of toroidal plasmas: tearing modes, magnetic Vll Vlll islands, and disruptions.

byu geometry part 1 final exam: Vertebrate Paleontology in Utah David D. Gillette, 1999 The 52 papers in this vary in content from summaries or state-of-knowledge treatments, to detailed contributions that describe new species. Although the distinction is subtle, the title (Vertebrate Paleontology in Utah) indicates the science of paleontology in the state of Utah, rather than the even more ambitious intent if it were given the title "Vertebrate Paleontology of Utah" which would promise an encyclopedic treatment of the subject. The science of vertebrate paleontology in Utah is robust and intense. It has grown prodigiously in the past decade, and promises to continue to grow indefinitely. This research benefits everyone in the state, through Utah's museums and educational institutions, which are the direct beneficiaries.

byu geometry part 1 final exam: Supervised Learning with Quantum Computers Maria Schuld, Francesco Petruccione, 2018-08-30 Quantum machine learning investigates how quantum computers can be used for data-driven prediction and decision making. The book summarises and conceptualises ideas of this relatively young discipline for an audience of computer scientists and physicists from a graduate level upwards. It aims at providing a starting point for those new to the field, showcasing a toy example of a quantum machine learning algorithm and providing a detailed introduction of the two parent disciplines. For more advanced readers, the book discusses topics such as data encoding into quantum states, quantum algorithms and routines for inference and optimisation, as well as the construction and analysis of genuine "quantum learning models". A special focus lies on supervised learning, and applications for near-term quantum devices.
