etreby pharmacy system: Arab Fall Eric Trager, 2016 How did Egypt's Muslim Brotherhood win power so quickly after the dramatic Arab Spring uprising that ended President Hosni Mubarak's thirty-year reign in February 2011? And why did the Brotherhood fall from power even more quickly, culminating with the popular rebellion and military coup that toppled Egypt's first elected president, Brotherhood leader Mohamed Morsi, in July 2013? In Arab Fall, Eric Trager examines the Brotherhood's decision making throughout this critical period, explaining its reasons for joining the 2011 uprising, running for a majority of the seats in the 2011-2012 parliamentary elections, and nominating a presidential candidate despite its initial promise not to do so. Based on extensive

research in Egypt and interviews with dozens of Brotherhood leaders and cadres including Morsi, Trager argues that the very organizational characteristics that helped the Brotherhood win power also contributed to its rapid downfall. The Brotherhood's intensive process for recruiting members and its rigid nationwide command-chain meant that it possessed unparalleled mobilizing capabilities for winning the first post-Mubarak parliamentary and presidential elections. Yet the Brotherhood's hierarchical organizational culture, in which dissenters are banished and critics are viewed as enemies of Islam, bred exclusivism. This alienated many Egyptians, including many within Egypt's state institutions. The Brotherhood's insularity also prevented its leaders from recognizing how quickly the country was slipping from their grasp, leaving hundreds of thousands of Muslim Brothers entirely unprepared for the brutal crackdown that followed Morsi's overthrow. Trager concludes with an assessment of the current state of Egyptian politics and examines the Brotherhood's prospects for reemerging.

etrey pharmacy system: Regulation of Hepatic Metabolism K. Jungermann, F.C. Kauffman, R.G. Thurman, 2012-12-06 The liver is an exceptionally complex and diverse organ that functions both as an exocrine and an endocrine gland. It secretes bile, which contains many constituents in addition to bile salts, and it synthesizes and releases many substances in response to the body's demands, including prohormones, albumin, clotting factors, glucose, fatty acids, and various lipoproteins. It has a dual blood supply providing a rich mixture of nutrients and other absorbed substances via the portal vein and oxygen-rich blood via the hepatic artery. This functional heterogeneity is accompanied by cellular heterogeneity. The liver contains many cell types including hepatic parachymal cells, Kiipffer cells, Ito cells, and endothelial cells. The most abundant cell type, the parenchymal cells, are biochemically and structurally heterogeneous. The cells in the oxygen-rich areas of the portal triad appear more dependent on oxidative metabolism, whereas those around the central vein (pericentral, perivenous, or centrolobular areas) are more dependent upon an anaerobic mechanism. Throughout this volume the latter three terms are used synonymously by various authors to indicate the five to eight layers of cells radiating from the central vein. Structural and metabolic heterogeneity of hepatic parenchymal cells has been demonstrated by a variety of approaches, including histochemical, ultra structural, and ultramicrobiochemical studies. This microheterogeneity is linked to the physiological functions of the liver and its response to injurious substances.

etrey pharmacy system: Clinical Endocrinology of Dogs and Cats A. Rijnberk, 2012-12-06 Clinical endocrinology is a fascinating field requiring the challenging combination of broad pathophysiological interest and specific expertise in the field of endocrinology, thereby occupying a common ground between biochemistry, physiology and clinical medicine. In the majority of cases the clinician's notion of the presence of an endocrine disease is largely based upon pattern recognition, in which physical changes play an important role. Therefore many color illustrations have been included throughout the text. In addition there are many full color graphs and illustrations of diagnostic imaging and pathology. With over 350 illustrations the book represents a richly illustrated text on the diseases of endocrine glands. For each gland there is an introductory section on the relevant morphology and physiology, followed by descriptions of the disorders of the gland. When endocrine diseases are quite different in dogs and cats, separate descriptions are given for these species. Protocols for function tests and emergency treatments are presented in the last chapters. Consequently the book provides the user with both comprehensive descriptions and quick references. The book has been written by leading clinicians in the field, with contributions from two biochemists, a radiologist and pathologist. As such a valuable textbook for veterinary students and practitioners has been compiled to fulfil the need for an up-to-date and complete book on endocrine diseases of dogs and cats.

This report notes recent trends in FDI and examines the progress made in moving toward compilation of FDI statistics in accordance with standards established by the IMF and the Organization for Economic Cooperation and Development (OECD). The report also reviews international recommendations for the compilation, analysis, and dissemination of FDI data and notes discrepancies in global balance of payments statistics and in data on bilateral FDI stocks. In addition, the report provides information on selected countries current practices in measuring FDI--on the basis of results from a joint IMF/OECD survey that covered 30 OECD countries and 31 other IMF member countries and was the subject of *Foreign Direct Investment Statistics: How Countries Measure FDI 2001*, published by the IMF and OECD in 2003.
