ibbotson erp: The Equity Risk Premium Bradford Cornell, 1999-05-26 Das Thema Risikoprämie für Aktien (Equity Risk Premium) wird hier zum ersten Mal verständlich erklärt. Die Risikoprämie für Aktien stellt einen Renditeausgleich dar für das erhöhte Risiko, das ein Anleger bei der Investition in Aktien eingeht, im Vergleich zu einer Investition in risikofreie Staatsanleihen. Die Risikoprämie ist zwar von der Theorie her einfach, jedoch in der Praxis ein sehr komplexes Phänomen. Für Finanzentscheidungen ist es von größter Bedeutung, daß man das Prinzip der Risikoprämie versteht und es anwenden kann. Cornell erläutert das Thema Schritt für Schritt sehr anschaulich und ohne terminologischen Ballast. Zunächst wird die Risikoprämie im Zusammenhang mit der Geschichte des Aktienmarktes betrachtet. Der Haussemarkt der 90er dient dabei als Fallstudie. Cornell zeigt, welche Rückschlüsse man durch die Analyse der Risikoprämie im historischen Verlauf für den Aktienmarkt ziehen kann, z.B. ob Aktienkurse steigen oder fallen oder ob sich der Aktienmarkt verändert. Vorausschauende Schätzungen der Risikoprämie werden anhand verschiedener konkurrierender Modelle analysiert, wobei die Vorzüge der jeweiligen Methode mitbewertet werden. 'Equity Risk Premium' ist das erste Buch, das dieses wichtige Prinzip der Risiko-Nutzen-Analyse erschöpfend behandelt. Es vermittelt einen tiefen Einblick und deckt alle Grundlagen ab, damit Investoren fundierte Finanzentscheidungen treffen können. Ein absolutes

Muß für institutionelle Anleger, Geldmanager und Finanzvorstände, die auf eine fundierte Marktanalyse zurückgreifen müssen. (06/99)

ibbotson erp: *The Equity Risk Premium: A Contextual Literature Review* Laurence B. Siegel, 2017-12-08 Research into the equity risk premium, often considered the most important number in finance, falls into three broad groupings. First, researchers have measured the margin by which equity total returns have exceeded fixed-income or cash returns over long historical periods and have projected this measure of the equity risk premium into the future. Second, the dividend discount model—or a variant of it, such as an earnings discount model—is used to estimate the future return on an equity index, and the fixed-income or cash yield is then subtracted to arrive at an equity risk premium expectation or forecast. Third, academics have used macroeconomic techniques to estimate what premium investors might rationally require for taking the risk of equities. Current thinking emphasizes the second, or dividend discount, approach and projects an equity risk premium centered on 3½% to 4%.

ibbotson erp: Financial Market Bubbles and Crashes, Second Edition Harold L. Vogel, 2018-08-16 Economists broadly define financial asset price bubbles as episodes in which prices rise with notable rapidity and depart from historically established asset valuation multiples and relationships. Financial economists have for decades attempted to study and interpret bubbles through the prisms of rational expectations, efficient markets, and equilibrium, arbitrage, and capital asset pricing models, but they have not made much if any progress toward a consistent and reliable theory that explains how and why bubbles (and crashes) evolve and can also be defined, measured, and compared. This book develops a new and different approach that is based on the central notion that bubbles and crashes reflect urgent short-side rationing, which means that, as such extreme conditions unfold, considerations of quantities owned or not owned begin to displace considerations of price.

ibbotson erp: Valuation for Arbitration Mark Kantor, 2008-01-01 This book provides a clear understanding of the nuts and bolts of valuation approaches for business investments, including market, income and asset-based methods. It reviews tools that arbitrators may employ to reach their final compensation assessment on a principled basis. The bookand□s many practical recommendations explore the decision making processes entailed in three central aspects of the arbitratorand□s role: and□ advance planning to enhance understanding of expert valuation evidence; and□ identification of and□apples-to-orangesand□ miscomparisons; and and□ recognition of the true comparability between the business at issue and other examples offered in the expert evidence. The presentation focuses not only on the legal standards applicable to the valuation (full or adequate compensation, reparations, restitution, actual loss, fair market value, fair or reasonably equivalent value, lost profits, etc.), but also on the informed judgment and reasonableness that must enter into the process of weighing the facts of each case and determining its aggregate significance. The book considers common valuation methods like discounted cash flows, adjusted present values, capitalized cash flows, adjusted book values and comparable sales and transactions. Additionally, it addresses means for arbitrators to assess expert valuation evidence in complex business investment disputes. andquot;Best book 2008 of the OGEMID awards!andquot;

ibbotson erp: Valuation for M&A Frank C. Evans, David M. Bishop, 2002-07-15 The only resource available to help calculate investment value versus fair market value Whether buying or selling, the question of what's it worth? is multifaceted. In an M&A setting, it is necessary to compute fair market value, but it is far more important to compute investment value-the value of the target company to a strategic buyer. This calculation varies with each prospective buyer, depending on synergies, benefits, and other competitive analyses that are seldom involved in business valuation. Valuation for M&A is the first book to focus on valuation for merger and acquisitions. This groundbreaking guide provides document request checklists, sample interview questions, a format for adjusting financial statements, a format for developing discount rates, a format for computation of net cash flow, and a valuation reconciliation form, all to help senior executives and M&A professionals better negotiate a successful deal. Frank C. Evans is a certified business appraiser (CBA), Accredited Senior Business Appraiser in Business Valuation (ASA), and CPA (accredited in business valuation) and David M. Bishop is a Master Certified Business Appraiser (MCBA), Accredited Senior Business Appraiser in Business Valuation (ASA), Fellow of the Institute of Business Appraisers (FIBA), and Business Valuator Accredited for Litigation (BVAL).

ibbotson erp: *Revisiting the Equity Risk Premium* Laurence B. Siegel , Paul McCaffrey , 2023-06-06 In 2001, Martin Leibowitz organized an Equity Risk Premium (ERP) Forum for CFA Institute, in which the participants discussed issues related to the ERP and made estimates for the future. This forum was repeated by Leibowitz, Brett Hammond, and Laurence Siegel in 2011, setting a precedent for a decennial forum. Siegel organized and moderated the discussion in 2021, and the proceedings from that event make up the current book. The participants in 2021 were (in alphabetical order) Robert Arnott, Clifford Asness, Mary Ida Compton, Elroy Dimson, William Goetzmann, Roger Ibbotson, Antti Ilmanen, Martin Leibowitz, Rajnish Mehra, Thomas Philips, and Jeremy Siegel. Each participant made a presentation, which was then discussed by the whole group. Finally, a roundtable discussion involving all of the participants was moderated by Laurence Siegel. Ibbotson and Dimson discussed historical returns in different countries. Ibbotson focused on the United States, while Dimson took a global industrial-country view. The history goes back almost a century (Ibbotson) or more than a century (Dimson), providing a look at how returns have evolved over a wide variety of conditions. Ibbotson also presented his method for making probabilistic forecasts of returns. Dimson, who is British, showed that “American exceptionalism” is one way to understand the results. Asness looked at the effectiveness of Robert Shiller’s CAPE (cyclically adjusted price-earnings ratio) valuation measure for forecasting. Valuations rose over the period he studied, and a lively discussion was had about why this may have occurred. Arnott focused on the growth rate of dividends, which has been very slow in per-share terms, and argued (with much debate from the other participants) that buybacks are only a partial substitute for dividends. Leibowitz, also looking at valuation as the lodestone of return forecasts, set forth a “growth adjustment” that brought his forecast in line with those made by others. Compton, a consultant to pension plans, discussed the challenges of communicating lower expected returns to clients. She also emphasized that expected returns “don’t always come true,” they’re just someone’s best forecast. Ilmanen broke up the expected return into its component parts: dividends, real growth, inflation, and so forth. Doing this, he said, allows one to debate the estimates for each part and ascertain how accurate each of the estimates is. Philips started by presenting a method for forecasting bond returns. He then turned to equities, for which he compared forecasts with subsequent realizations using a variety of forecast methods. Mehra discussed a number of issues related to the existence of premiums (equity risk, value, small cap, and so forth) and concluded that, although some of these are unstable, the ERP is highly stable. Jeremy Siegel advocated a “back to basics” approach using dividend and earnings yields, dividend and earnings growth rates, payout ratios, and price-to-earnings ratios. He emphasized that earnings can be calculated in a number of different way, and said that accounting practices have become more conservative over the years. Goetzmann concluded the session by reporting that one company, a water mill in France, had almost 600 years of historical return data and that an asset pricing model could be tested using those data. According to this model, the stock price is the present value of expected future dividends and is supported by the evidence. In sum, because of high valuations and low interest rates, the participants expect lower total returns in the future than in the past. A forward-looking ERP of 4% to 5% was the consensus of the group.

The authors use the historical performance of the world's stock markets to address these issues.

Kaplan, 2011-11-29 Innovative approaches to putting asset allocation into practice Building on more than 15 years of asset-allocation research, Paul D. Kaplan, who led the development of the methodologies behind the Morningstar Rating(TM) and the Morningstar Style Box(TM), tackles key challenges investor professionals face when putting asset-allocation theory into practice. This book addresses common issues such as: How should asset classes be defined? Should equities be divided into asset classes based on investment style, geography, or other factors? Should asset classes be represented by market-cap-weighted indexes or should other principles, such as fundamental weights, be used? How do actively managed funds fit into asset-class mixes? Kaplan also interviews industry luminaries who have greatly influenced the evolution of asset allocation, including Harry Markowitz, Roger Ibbotson, and the late Benoit Mandelbrot. Throughout the book, Kaplan explains allocation theory, creates new strategies, and corrects common misconceptions, offering original insights and analysis. He includes three appendices that put theory into action with technical details for new asset-allocation frameworks, including the next generation of portfolio construction tools, which Kaplan dubs Markowitz 2.0.
